Maintenance Checklist

A simple rhythm for keeping every website-plus-voice-agent client healthy, paid, and happy

Follow this every month. Nothing slips.

Tick the boxes as you go. The whole routine takes roughly 30–45 minutes per month per client, on average.

Your Monthly Rhythm

Do these in order. Set two recurring calendar reminders on your phone: **the 1st** (invoicing + recap) and **the 15th** (spot check). Everything else is reactive.

The 1st of Every Month — 20 minutes

- Pull last month's stats: voice-agent call count + minutes used, contact form submission count.
- Write Jon a short recap email: *"Hi Jon — last month the site had X visitors, Y form submissions, and Z voice-agent calls (W minutes of Q used). Anything you want updated this month?"*.
- Send Invoice #XXXX for \$99 monthly service via your invoicing tool.
- Log payment status in your income tracker (paid / pending / overdue).
- If he's approaching the 50-minute voice cap, mention it in the recap: *"You used 42 of your 50 minutes last month — a strong signal business is picking up. If we go over, it's \$1/min, but at this pace you're fine."*.

The 15th of Every Month — 5 minutes

- On your phone, type **fullcirclewoodworx.com** into Safari. Site loads? Images visible? Buttons work? .
- Open your Gmail, search for form submissions from the past 7 days — are you still receiving them? (If no form fills, send yourself a test submission just to confirm the pipeline).
- Peek at the voice-agent automation scenario — is it still active and firing? (If paused, reactivate; if operations ran out, upgrade the tier).
- Check the voice-agent dashboard for any failed calls or errors.

End of Month — 5 minutes

- Did Jon pay the invoice? If yes, log it. If not, send a gentle reminder: *"Just a nudge on last month's invoice — no rush, just making sure it didn't get lost."*.
- Set aside 25–30% of the month's income in your tax savings account.
- Update your simple income spreadsheet: month / invoice # / amount / paid date.

Quarterly Deep Checks

Do these in **January, April, July, and October**. About 1–2 hours of work total. Block a Wednesday morning for it and knock them all out in one sitting.

Content Refresh

- Text Jon: *“Hey — quarterly check-in. Any new slab photos, finished project photos, updated hours, or new services to add to the site?”*.
- If he sends photos: compress them to under 300KB each (use TinyPNG.com), swap into the gallery section of the site, rebuild the deploy zip, drag to host.
- Review the voice-agent script — is it still asking the right questions? Has he added a new service that should be captured?.
- Verify the reviews section is still accurate — any new 5-star reviews on Google or Facebook worth adding?.
- Update the copyright year in the footer if the calendar has flipped.

Technical Health Checks

- Confirm the SSL certificate is still valid (auto-renews every 90 days — just verify).
- Check domain expiration date; if within 60 days, remind Jon to renew.
- Export the form submissions CSV as a backup and stash it in your cloud drive.
- Review usage of all supporting services — any approaching free-tier limits?.
- Test the full journey end-to-end yourself: call the voice agent, fill out the form, confirm both emails arrive at Jon **and** you (BCC).

Yearly Tasks

- Domain renewal nudge to Jon (~\$15/yr, his account).
- Year-end recap email: *“Jon, quick look back: the site captured X calls and Y inquiries this year. At even a conservative conversion rate, that's roughly \$Z in potential business we wouldn't have reached otherwise.”* — this is your **contract renewal moment**.
- Tax prep: pull full-year income report from your invoicing tool, total it up, save the file.
- Consider a small price increase (\$99 → \$109 or \$119) after Year 1 — give Jon 60 days' notice and frame it as infrastructure costs.
- Review if it's time to form an LLC for liability protection (usually worth it once you have 3+ clients).

Common Client Requests — Time Budget

When Jon texts you with a change, use this to quickly estimate how long it'll take. If a request is **outside this list**, it's probably **out of scope** — quote it as extra.

Request	Real Time	Included in \$99/mo?
Update phone number or email	2 minutes	Yes
Change hours of operation	2 minutes	Yes
Swap an existing photo for a new one	5 minutes	Yes
Add a new wood species / service card	15–20 minutes	Yes
Add a holiday banner or temporary notice	10 minutes	Yes
Update voice-agent questions	15 minutes	Yes
Add a new customer review	5 minutes	Yes
Add a new full page (e.g., Blog, Shop)	4–8 hours	NO — quote as extra
Write blog posts / SEO articles	2–3 hours each	NO — \$75–\$150/post
Design a new logo	varies	NO — outsource or quote
Manage Google Ads / SEO campaigns	ongoing	NO — separate \$250+/mo service
Full site redesign	20–40 hours	NO — quote as new project

The magic phrase when a request is out of scope: *"I love that idea — it's outside what the monthly covers, but I'd be happy to put together a quick quote. Mind if I send you an estimate?"*

Never do extra work for free. Even small unpaid favors create the expectation that you do small unpaid favors — and those compound. Every out-of-scope ask gets a polite quote.

Emergency Troubleshooting

When Jon texts you something is broken, stay calm. 95% of the time it's one of these five things. Match the symptom, apply the fix, bill the peace of mind.

Symptom	Likely Cause	Fix
Site won't load	Hosting outage or DNS hiccup	Check host status page first. If green, test DNS by pinging domain from your phone. Usually resolves in minutes.
Form submissions not arriving	Form detection toggled off, or email filter	Verify form detection is ON in host dashboard. Ask Jon to check spam folder + whitelist sender.
Voice agent emails stopped	Automation scenario paused or out of ops	Open automation dashboard, reactivate scenario, upgrade tier if needed.
Voice agent not answering calls	Agent credits exhausted, or phone routing issue	Check voice-agent dashboard for billing status, top up credits, verify phone number is still active.
Page looks broken on mobile only	Browser cache after a recent update	Have Jon hard-refresh (hold reload button in Safari). If still broken, re-deploy latest zip.
Domain shows "not secure"	SSL cert didn't renew	In host dashboard, click "Provision HTTPS certificate" again. Wait 2–10 minutes.
Domain expired and site is dead	Jon forgot to renew	Jon logs into registrar and pays the renewal fee. Site comes back once DNS repropagates (a few hours).

The Three Rules When Something Breaks

- ★ **Respond fast, fix when you can.** A reply within 15 minutes saying *"On it, I'll check now"* is worth more than a silent 2-hour fix. Jon feels cared for.
- ★ **Never admit blame in writing** until you know the cause. *"Let me look into it"* is neutral and safe. *"I must have broken something"* creates liability.
- ★ **Document the fix.** When something breaks, write down what it was and what fixed it in a simple notes file. Next time you'll solve it in 2 minutes instead of 20.

Your Emergency Contacts List: Put these logins somewhere you can find them fast (a password manager like Bitwarden or 1Password).

- Hosting dashboard login
- Domain registrar login (ask Jon for this at launch)
- Voice-agent dashboard login
- Automation/workflow tool login
- Jon's phone number and business email (for urgent calls)

— End of checklist —

Print this, screenshot this, tape it to the fridge. The more automatic this rhythm becomes, the more scalable your business gets.
